

Principles of Practice

COMPREHENSIVE ASSESSMENT

Conduct a comprehensive assessment. Rule out medical causes of behavioral symptoms. Use validated measures to assess and track psychiatric symptoms and impairment.

- A comprehensive mental health assessment includes:
 - ◆ Assessment of risk of harm to self or others
 - ◆ Assessment of the full range of psychiatric symptoms and disorders, as well as impairment from these symptoms and disorders
 - ◆ A thorough mental status exam
 - ◆ A full medical history
 - ◆ A relevant medical work-up and physical examination
 - ◆ Assessment of substance use, including tobacco use
 - ◆ Assessment of family psychiatric history, which includes psychiatric symptoms/treatment of family members, including substance use and treatment
 - ◆ Assessment for social determinants of health (e.g., housing instability/homelessness, food insecurity, education level, employment status)
- Ongoing management of behavioral health conditions includes:
 - ◆ Use of measurement-based care to measure and monitor symptoms and side effects
 - ◆ Close follow-up after psychotherapeutic medication prescribing to assess medication tolerability
 - ◆ Assessment of benefits and risks of treatment, including review of boxed warnings
 - ◆ Patient education of the benefits and risks of treatment, including review of boxed warnings
 - ◆ Monitoring of physical health parameters (See Program publication Monitoring Physical Health and Side-Effects of Psychotherapeutic Medications in Adults and Children: An Integrated Approach available at floridamedicaidmentalhealth.org.)
 - ◆ Assessment of social support system (housing, family, other caregivers)
 - ◆ Evaluation of threats to continuity of care (financial burden, housing instability, access to medication, medication adherence, etc.)
 - ◆ Provision of patient tools/support for recovery and self-management

Notes:

- *Effort should be made to communicate between primary care providers, psychiatrists, case workers, and other team members to ensure integrated care*
- *Incorporate collaborative/shared treatment decision-making with patients, family and caregivers*
- *Written informed consent should be obtained from the patient or the individual legally able to consent to medical interventions (e.g., pharmacotherapy), and documented in the chart*

Principles of Practice (continued)

ADJUNCTIVE PSYCHOSOCIAL TREATMENTS (AS INDICATED)

- Individual and family psychoeducation
- Cognitive-behavioral therapy (CBT)
- Interpersonal psychotherapy (IPT)
- Interpersonal and social rhythm therapy (IPSRT)
- Family-focused therapy
- Group psychoeducation (especially for bipolar disorder)
- Social skills training (especially in schizophrenia)
- Cognitive remediation/rehabilitation (to improve attention, memory, and/or executive function)

Note on pharmacogenomics testing: Limited data exists examining whether patient care that integrates pharmacogenomic test information results in better or safer treatment.

MEASUREMENT-BASED CARE

Questionnaires and rating scales are useful tools for diagnostic assessment and evaluation of treatment outcomes, and such instruments can be helpful in providing information to supplement clinical judgement. The integration of measurement scales into routine clinical practice is suggested for each of the conditions covered in this document. Clinicians should use rating scales to assess symptom severity during the initial evaluation/treatment, when medication changes are implemented, and/or when the patient reports a change in symptoms.

- Treatment targets need to be precisely defined.
- Effectiveness and safety/tolerability of the medication treatment must be systematically assessed by methodical use of appropriate rating scales and side-effect assessment protocols.

Internet links to the following scales are available on the Program website:

floridamedicaidmentalhealth.org.

- Beck Depression Inventory (BDI)
- Brief Psychiatric Rating Scale (BPRS)
- Clinical Global Impression (CGI) Scale
- Clinician-Rated Dimensions of Psychosis Symptom Severity (CRDPSS)
- Hamilton Rating Scale for Depression (HAM-D)
- Montgomery-Asberg Depression Rating Scale (MADRS)
- Patient Health Questionnaire (PHQ-9)
- Positive and Negative Syndrome Scale (PANSS)
- Quick Inventory of Depression Symptomatology (QIDS)
- Young Mania Rating Scale (YMRS)

Principles of Practice *(continued)*

Table 1. Assessment Scales for Adult Behavioral Health Conditions

Measures	Bipolar Acute Depression	Bipolar Acute Mania	Bipolar 1 Cont/Main Therapy	Major Depression	Major Depression with Mixed Features	Major Depression with Psychosis	Schizophrenia
Beck Depression Inventory (BDI)	✓	—	—	✓	✓	✓	—
Brief Psychiatric Rating Scale (BPRS)	—	—	—	—	—	✓	✓
Clinical Global Impression (CGI) Scale	—	—	—	—	✓	—	✓
Clinician-Rated Dimensions of Psychosis Symptom Severity (CRDPSS)	—	—	—	—	—	✓	✓
Hamilton Rating Scale for Depression (HAM-D)	—	✓	—	—	—	✓	—
Montgomery-Asberg Depression Rating Scale (MADRS)	✓	✓	✓	—	✓	✓	—
Patient Health Questionnaire (PHQ-9)	✓	—	✓	✓	✓	—	—
Positive and Negative Syndrome Scale (PANSS)	—	—	—	—	—	✓	✓
Quick Inventory of Depression Symptomatology (QIDS)	✓	—	✓	✓	✓	—	—
Young Mania Rating Scale (YMRS)	✓	✓	✓	—	✓	—	—

**Notes: The recommendations in this table are based on the evidence-base and clinical consensus. The Montgomery-Asberg Depression Rating Scale (MADRS) and Hamilton Rating Scale for Depression (HAM-D) can also be used to assess symptoms of depression in major depressive disorder. Although the MADRS and HAM-D do not assess manic symptoms, these scales are recommended to evaluate depression symptoms in individuals presenting with bipolar mania (e.g., to rule out bipolar disorder – mixed features) and to assess for depressive symptoms among individuals on maintenance treatment for bipolar disorder.*

LIST OF ANTIPSYCHOTIC MEDICATIONS AVAILABLE IN THE UNITED STATES:

- First Generation Antipsychotics (FGAs): chlorpromazine, fluphenazine*, haloperidol*, loxapine, perphenazine, thioridazine, thiothixene, and trifluoperazine
- Second Generation Antipsychotics (SGAs): aripiprazole*, asenapine, brexpiprazole[†], cariprazine[†], clozapine, iloperidone, lurasidone, olanzapine*, paliperidone*, quetiapine, risperidone*, and ziprasidone

Notes:

Medications indicated by a single asterisk (*) are available in long-acting injectable formulations (refer to list below).

[†]Brexpiprazole and cariprazine were introduced in 2015.

LIST OF LONG-ACTING INJECTABLE ANTIPSYCHOTIC (LAI) MEDICATIONS AVAILABLE IN THE UNITED STATES:

- First Generation Antipsychotics (FGAs): fluphenazine decanoate, haloperidol decanoate
- Second Generation Antipsychotics (SGAs): aripiprazole monohydrate, aripiprazole lauroxil, olanzapine pamoate, paliperidone palmitate, risperidone microspheres

TREATMENT WITH ANTIPSYCHOTIC MEDICATION

Selection of antipsychotic medication with well-informed patients should be made on the basis of evidence-based guideline recommendations for a particular behavioral health condition, prior individual treatment response, side-effect experience, medication side-effect profile, and long-term treatment planning. Treatment with antipsychotic medications should take into account the following:

- First generation antipsychotics (FGAs) and second generation antipsychotics (SGAs) are heterogeneous within the class and differ in many properties, such as efficacy, side-effects, and pharmacology.
- Antipsychotics carry extrapyramidal symptoms (EPS) liability and metabolic effects.
- Caution should be used in prescribing antipsychotic medication in the context of dementia, anxiety disorders, and impulse control disorders. For these conditions, antipsychotic utilization should be:
 - ◆ Aimed at target symptoms
 - ◆ Prescribed only after other alternative treatments have been tried
 - ◆ Used in the short-term
 - ◆ Monitored with periodic re-evaluation of benefits and risks
 - ◆ Prescribed at the minimal effective dose

Note:

The Food and Drug Administration (FDA) has issued a boxed warning that elderly patients with dementia-related psychosis treated with FGAs or SGAs have an increased risk of death.

Principles of Practice (continued)

ACHIEVING OPTIMAL OUTCOMES WITH CURRENTLY AVAILABLE ANTIPSYCHOTICS

STEP 1 – Considerations for selecting the most appropriate antipsychotic for a particular patient:

- ◆ Equivalent efficacy across agents
- ◆ Individual variability in response
- ◆ No reliable pre-treatment predictor of individual response to different agents
- ◆ Different agents have different side-effects and safety profiles
- ◆ Individual patients have different vulnerabilities and preferences
- ◆ Risk of non-adherence to oral antipsychotics

STEP 2 – Proper antipsychotic trial sequence:

- ◆ Begin with systematic 6 to 10 week trial of one antipsychotic with optimal dosing.
- ◆ If inadequate response, follow with systematic trial of monotherapy with one or more antipsychotics at adequate dose and duration.
- ◆ If inadequate response, follow with a trial of clozapine or a long-acting antipsychotic.
- ◆ Follow with a trial of clozapine, if not tried before.

Note: Recent evidence suggests that long-acting injectable antipsychotic medications should be offered early as a treatment option for all individuals diagnosed with schizophrenia to reduce the risk of non-adherence, prevent future relapse/deterioration, and improve treatment outcomes.

- ◆ If insufficient response with the previously listed therapies, consider other strategies (e.g. antipsychotic polypharmacy).

Principles of Practice (continued)

STEP 3 - Good practice guidelines for ongoing antipsychotic treatment:

- ◆ Measurement-based individualized care
- ◆ Repeated assessment of efficacy using reliably defined treatment targets (use standard rating scales, e.g. CRDPSS, CGI, BPRS, PANSS)
- ◆ Careful assessment and measurement of adverse effects
- ◆ Care consistent with health monitoring protocols
- ◆ Standard protocols customized to individual vulnerabilities/needs and specific agent
- ◆ Ongoing collaboration with patient in decision-making

Notes:

CRDPSS = Clinician-Rated Dimensions of Psychosis Symptom Severity; CGI = Clinical Global Impressions Scale; BPRS = Brief Psychiatric Rating Scale; PANSS = Positive and Negative Syndrome Scale

Box 1.

Factors that Contribute to Poor Medication Adherence

REMEMBER TO ASSESS FOR MEDICATION ADHERENCE

Factors that contribute to poor medication adherence include:

- ◆ Poor health literacy
- ◆ Lack of involvement in the treatment decision-making process
- ◆ Complex drug regimens
- ◆ Ineffective communication about adverse effects
- ◆ Limited access to care
